

London Housing Policy Evidence Base

Sep 26, 2026 · @Manuel

Purpose and scope

This document brings the project's source files together into one evidence base for the tool. The tool connects policymakers with what stakeholders care about. It offers policy recommendations as a starting point, not finished policy.

- **Context data** (English Housing Survey reports and tables) describes the problem: costs, tenure, housing support, moving and housing stock.
- **Policy evidence** (six evaluations and reviews) shows what past interventions did, who they affected and how strong the evidence is.
- **Coverage:** mostly England-wide, with London broken out where the source does. Data tables run from 2008-09 to 2024-25, and the moving-home trend from 1984. Evaluations date from 2015 to 2024.

Each policy card uses the same fields so the cards can be loaded into the tool as structured records.¹

The problem in numbers

London renters pay the most and struggle the most. In 2018-19, London private renters spent 40% of their income on rent, against 33% for England as a whole, which includes London. In 2024-25, the average English private rent was about £250 a week before housing support, in cash terms. After inflation, that is about the same as in 2017-18.²

Affordability over time (England)

Measure	2013-14	2019-20	2023-24
Share of income on housing: private renters	33.9%	31.9%	34.0%
Share of income on housing: social renters	28.6%	26.6%	26.4%
Share of income on housing: mortgagors	17.9%	17.8%	18.7%
Finding housing costs difficult: private renters	32.6%	27.0%	32.1%
Finding housing costs difficult: social renters	40.9%	27.4%	28.4%
Finding housing costs difficult: mortgagors	not asked	not asked	14.0%

Source: EHS 2023-24, Chapter 1 figures 1.1 and 1.2.

London compared with the rest of England

Measure	London	Comparison	Compared with	Year
Mean private rent (£/week)	£300	£153	Rest of England	2015-16
Private renters' share of income on rent	45%	32%	Rest of England	2015-16
Social renters' share of income on rent	32%	27%	Rest of England	2015-16
Mean private rent (£/week)	£341	£200	All England (incl. London)	2018-19
Private renters' share of income on rent	40%	33%	All England (incl. London)	2018-19
Renters reporting difficulty paying	36%	25%	All other regions	2018-19
Mortgagors reporting difficulty paying	7%	4%	All other regions	2018-19
Home ownership rate	51%	65%	All England (incl. London)	2020

The comparison groups differ by source, so compare London with its own row's comparison, not across rows.³ Both rent-share years use household income including Housing Benefit, so London's 45% and 40% are on the same basis. They come from separate survey reports, though, and are not a tested trend.⁴ At 2024-25 prices (CPI), London's mean private rent was £404 a week in 2015-16 and £432 in 2018-19.

In 2015-16, a mortgage in London cost less per week than private rent. Outside London the two costs were about the same.

Rents, income and savings (England)

- **Rents:** mean private rent before housing support went from £193 to £250 a week in cash terms between 2017-18 and 2024-25, a 30% rise that matched inflation, so the real rent was flat. Mean social rent went from £103 to £129, 3% lower in real terms (FA3201).
- **Savings:** 47% of households had no savings in 2018-19. The share was 82% among social renters and 61% among private renters.
- **Getting in:** 77% of private renters paid a deposit in 2018-19, up from 70% in 2008-09. Among first-time buyers, 45% took mortgages of 30 years or more, up from 33%.
- **Income:** about 70% of social renters were in the bottom two income quintiles in 2018-19.

Rents after inflation

After inflation, the mean private rent in England is no higher than in 2016-17. The 30% cash rise from 2017-18 to 2024-25 matched consumer price inflation (CPI up 29.5%). Social rents fell 3% in real terms over the same years.

Mean weekly rent before housing support, England. Solid = 2024-25 prices (CPI); dashed = cash.

EHS FA3201 means, deflated by ONS CPI (D7BT) · 2014-15 to 2024-25

Method: each EHS survey year runs April to March, so each year's rent is deflated by the average CPI for that April to March and shown at 2024-25 prices. CPI is used rather than CPIH because CPIH already includes rents. The chart starts in 2014-15, when FA3201 switched to households paying rent. UK CPI inflation was 3.1% in the 12 months to August 2026 ([ONS CPI annual rate](#), released 16 September 2026). Index used: [ONS CPI index D7BT, 2015=100](#). Real rent says nothing about incomes; the share-of-income figures above cover affordability.

Tenure and stock

- **London stock (2024):** 3.8 million dwellings, of which 51% are owner occupied, 28% privately rented and 21% socially rented (DA1101). London has the most private renting of any region.
- **Tenure shift (2010–2020):** private renting grew in every region while social renting mostly shrank. Outright ownership rose from 32% to 35% and mortgaged ownership fell from 34% to 30%.
- **Condition:** 15% of homes in England were non-decent in 2020, including 23% of private rented homes, 14% of owner-occupied homes and 11% of social homes. London's non-decency rate is among the lowest, despite its older stock.

Housing support and mobility

- **Who gets housing support (2024-25, FA3221):** 49% of social-renter recipients live alone. Lone parents make up 33% of private-renter recipients. 30% of private-renter recipients work full time, so housing support is not only an out-of-work benefit.
- **Coverage (2018-19):** 38% of renters received Housing Benefit. It covered only part of the rent for 82% of private-renter recipients.
- **Moving:** 7.3% of households moved in 2024-25, against 8% to 11% a year between 2008-09 and 2018-19; most of the fall came after 2019 (FT4101). Figures before 2008-09 come from different surveys and are not directly comparable. Private renters move most: 20% moved in the last year, against 6% of social renters and 4% of owners (FA4121).

Policy evidence cards

The firmest findings are narrow. Estate renewal and wider regeneration reliably raised property prices, but showed little measurable effect on jobs, crime or health. No study tracked existing residents.

Housing First and the London Homelessness SIB improved housing outcomes for the people they supported. These results can't be ranked directly against the place-based ones. The place-based reviews measured area-wide economic outcomes against comparison areas, while the SIB evidence is mainly performance against provider-set targets. Neighbourhood saturation is people-focused and has the strongest methods here, yet it mostly did not raise employment.

Every card uses the same core fields: Aim, Source and scope, What worked, What didn't, Key caveat and Evidence strength. Evidence strength uses the Maryland Scientific Methods Scale (SMS) from the What Works reviews. It runs from 1 to 5: 5 is a randomised trial, and 3 is a before-and-after comparison with a control group. Qualitative and process evaluations are marked not scored.

1. Estate renewal

Field	Evidence
Aim	Improve housing quality and the built environment, often justified as a boost to local growth.
Source and scope	What Works Centre for Local Economic Growth, systematic review (Jan 2015). About 1,050 evaluations screened, 21 met the quality bar. UK and OECD.

Field	Evidence
Target	Area-based schemes that refurbish, demolish, rebuild or build homes, including public housing estates. The review counts New Deal for Communities as estate renewal, so it overlaps with card 2.
Results by outcome	Property, land prices and rent: 7 positive, 2 mixed (of 9). Housing quality: 1 positive, 3 zero. Employment: 1 positive, 3 zero, 1 mixed. Crime: 4 zero, 3 mixed. Health and wellbeing: 6 mixed. Education: 4 zero. Deprivation: 2 zero. Income and wages: 2 positive.
What worked	Reliably raises property and land prices and rents, though not always for nearby homes that were not improved.
What didn't	Little or no measured effect on employment, deprivation, crime, health or education. Only 1 of 4 studies found better housing quality. The review treats housing and amenity gains as the main purpose but did not test them.
Key caveat	No study separated effects on existing residents. Area gains, including the 2 positive income results, may reflect richer households moving in.
Evidence strength (SMS)	SMS 3 to 4: 3 studies at SMS 4, 18 at SMS 3, none randomised. The review says the studies are too few and too varied for an overall verdict.

2. Neighbourhood saturation programmes

Field	Evidence
Aim	Support every out-of-work resident in one area so a critical mass of success spreads through the community.
Source and scope	What Works Growth toolkit (2018). Four employment studies (two on US Jobs-Plus, UK Employment Zones, UK StepUP) plus six New Deal for Communities (NDC) studies.

Field	Evidence
Components	Financial incentives, childcare, job training, mentoring and community building.
What worked	Gains for some groups: the largest ethnic group on each Jobs-Plus site (with big differences between women and men), less employable residents and 30–49 year-olds. Jobs-Plus raised earnings: 2 of 3 earnings studies were positive.
What didn't	Only 1 of 4 studies found gains in overall employment. StepUP found no earnings effect, and earnings fell for the most employable. NDC did no better on jobs and had mixed effects on crime and health. It raised neighbourhood satisfaction but not satisfaction with housing.
Cost-effectiveness	Costs usually exceed benefits: Jobs-Plus returned about 80p in earnings per £1 spent. Targeted help within areas looks better value than saturation.
Key caveat	Area gains last only if residents stay: they were larger where residential mobility was low. NDC was steered by residents.
Evidence strength (SMS)	SMS 2 to 5: two randomised trials of Jobs-Plus (SMS 5), Employment Zones at SMS 3 and StepUP at SMS 2. The six NDC studies are SMS 3. The strongest methods in this document, but only four employment studies.

3. London Homelessness Social Impact Bond

Field	Evidence
Aim	Bring new finance and outcome-based contracts to entrenched rough sleepers that existing services missed.
Source and scope	ICF qualitative evaluation for DCLG, final report executive summary (Nov 2017). London only.
Period and scale	November 2012 to October 2015, plus a 12-month payment tail. A fixed cohort of 830 people (529 seen in Westminster).

Field	Evidence
Who delivered	DCLG funded; the GLA commissioned. St Mungo's and Thames Reach delivered, backed by social investors.
Model	A 'Navigator' key worker providing persistent, personalised support from the street to a sustained tenancy, with a flexible personal budget.
Payment by results	Stable accommodation 40%, reduced rough sleeping 25%, reconnection 25%, employability 5%, health 5%.
Results	443 people (53%, or 71% excluding those who disappeared or died) reached accommodation or reconnection. That count includes hostel places, which were not paid for. Sustained accommodation beat targets: 241 at 12 months (target 219) and 164 at 18 months (target 154). Full-time jobs sustained for 13 weeks: 63 (target 30). Entry to stable accommodation narrowly missed its target, and rough-sleeping and reconnection targets were missed. Health data was never obtained.
What worked	A trusting, persistent relationship; a focus on getting housed first; care coordination across agencies; many placements into private rented homes. No evidence of 'cherry picking'. Investors were repaid with interest.
What didn't	Three years was too short for the most complex needs. Qualification and volunteering targets were set too high. Social investors added little to large, established providers.
Key caveat	The targets were set by the providers themselves, so beating them is not the same as a measured effect.
Evidence strength (SMS)	Not scored: qualitative evaluation. A separate DCLG impact evaluation found significant positive effects on rough sleeping and on entry to long-term accommodation over the first two years. It did not assess whether tenancies were sustained. ⁵
London relevance	High: London-specific and commissioned by the GLA.

4. Housing interventions for 'housing-vulnerable' adults (Housing First and others)

Field	Evidence
Aim	Improve housing stability and wellbeing for homeless and other housing-vulnerable adults.
Source and scope	What Works Wellbeing / University of Sheffield systematic review (May 2018). 90 publications, 47 of them on Housing First.
What worked	Housing First: high-certainty evidence of better housing stability and physical health in the short term, and moderate evidence of better personal wellbeing and mental health. Supported housing: moderate evidence of better housing stability. Recovery housing helps wellbeing through abstinence.
What didn't	Housing First is not cost-saving, as is sometimes claimed. There is moderate evidence of no effect on personal finances or community wellbeing. It suits people with high needs; alternatives are likely better value for people with lower needs. A minority of tenants became more isolated.
Structural point	The review says affordability problems need structural change, not only individual interventions. Loss of a private tenancy was the top cause of homelessness in England (27% of acceptances, Q4 2017).
Key caveat	Much of the Housing First evidence comes from one large Canadian trial (At Home/Chez Soi), backed by weaker but more applicable UK evaluations. ⁶ Youth housing studies are small and mostly uncontrolled.
Evidence strength	Not scored on SMS: the review uses GRADE certainty ratings. High for Housing First on housing stability and physical health; moderate for wellbeing and mental health; low or very low for other outcomes and for cost-effectiveness.

5. Towns Fund (Town Deals and Future High Streets Fund)

Field	Evidence
Aim	Regenerate towns and high streets. 101 places had Town Deals, each run by a Town Deal Board with the local authority.
Source and scope	MHCLG evaluation by Frontier Economics and BMG Research. Interim reports from October 2024, based on 3 and then 7 case studies.
What worked	Allocation-based funding reached places in need. Boards made decisions more inclusive. Early consultation with residents and businesses built support. Capacity funding filled skills gaps. Facilities are well used, and higher use correlates with more pride in place and wellbeing.
What didn't	Councils lacked staff and business-case expertise. Timelines were tight. Inflation and COVID-19 raised costs. There was no funding to run facilities after the programme. Monitoring returns were seen as lengthy.
Barriers to outcomes	A perception of limited consultation, and disruption from wider regeneration works.
Key caveat	Findings are interim and short-term. The final evaluation was due in March 2026. ⁷
Evidence strength (SMS)	Not scored: process evaluation built on case studies, with no counterfactual yet and no baseline data for pride in place.

6. Levelling Up Fund interventions

Field	Evidence
Aim	Guide bids for the first round of the Levelling Up Fund: transport, regeneration and town centres, and culture.

Field	Evidence
Source and scope	What Works Growth evidence briefing (March 2021). Draws on its reviews of transport, estate renewal, public realm, and culture and sport. Economic outcomes only.
What worked	Transport has the most positive evidence for economic outcomes, but depends heavily on context. Road and rail projects tend to raise nearby property prices. Some evidence that road projects raise wages, incomes and productivity.
What didn't	Road schemes have mixed effects on jobs and may displace activity from neighbouring areas. Big schemes such as London Docklands change who lives and works in an area, with little evidence of benefit to existing residents. Smaller built-environment and culture projects rarely produce economic growth, but may improve quality of life.
Key warning	Transport, estate renewal and public realm schemes raise property values locally. Owners gain and renters lose. Unless wages rise, some existing residents may be priced out.
Recommendation	Where funding must go on physical works, fund well-evidenced quality-of-life measures rather than chase unrealistic growth goals. Pair works with skills investment.
Key caveat	A summary of earlier reviews, not new research. The warning about renters is the authors' reasoning from price effects, not a measured outcome.
Evidence strength (SMS)	Not scored directly: it inherits the ratings of the underlying What Works reviews (the estate renewal review admits SMS 3 and above). Evidence on rail, bus, tram and cycling is very thin.

7. Social Housing Decarbonisation Fund Demonstrator and Whole House Retrofit

Field	Evidence
Aim	Retrofit social homes to high energy standards at lower cost, and build up the retrofit supply chain.
Source and scope	Ipsos evaluations for BEIS/DESNZ: process report (June 2023) and outcome and economic report (2023).
Period and scale	WHR from 2019 (£7.7m, 4 projects, including Energiesprong Sutton in London). SHDF(D) from 2020 (£62m, 19 projects).
Who delivered	BEIS/DESNZ; delivery partner Ricardo; councils and housing associations.
Results	Of an initial 2,273 SHDF(D) homes, 1,143 were complete by April 2023. WHR's two remaining projects shrank from 195 to 68 homes and from 100 to 23. Two WHR projects withdrew. In an unweighted survey of about 250 residents, 84% of those whose work was finished liked how their home looked. 37% said their bills had fallen and 20% said they had risen. ⁸
What worked	A shared monthly learning community across projects. Resident liaison officers whom tenants trusted. Show homes that let tenants see results before signing up. Innovation such as robotic insulation.
What didn't	Deadlines of 12–18 months were unrealistic. Supply chains were immature and COVID-19 disrupted work. The PAS 2035 retrofit standard added cost and delay. Costs rose 12% per home on average against a planned 25% cut, and 14 of 16 projects installed fewer measures. Only half of residents were satisfied with communication from their landlord.
Key caveat	Bill savings were modelled at 2023 energy prices; at 2021 prices they would be 55–85% lower. A third of surveyed residents' work was not finished when they answered.

Field	Evidence
Evidence strength (SMS)	Not scored: theory-based evaluation without a counterfactual. No pre-retrofit data was collected from tenants.

Cross-cutting lessons

Five lessons repeat across the evaluations. Each can become a check the tool applies to a proposed policy.

- 1. Physical regeneration raises property values, and renters may lose out.** Estate renewal raised prices, land values or rents in 7 of 9 studies, and the Levelling Up briefing expects the same from transport and public realm schemes. No study measured what happened to renters, so this is a risk to test, not a finding. With London private renters paying about 40% of income on rent, displacement is the main risk to test for.
- 2. Area gains are not the same as gains for existing residents.** No estate renewal study tracked the original residents. Saturation benefits only stayed in an area when residents stayed.
- 3. Support built around people improved housing outcomes for those supported.** The SIB's Navigator model and Housing First both improved housing stability. The shared features were persistence, trust, housing first and coordination across agencies. This evidence measures individual outcomes, so it can't be ranked directly against area-wide results.
- 4. Engaging residents drives success and satisfaction.** Towns Fund consultation built local support, and a perceived lack of it held back outcomes. In SHDF(D), residents unhappy with communication were far more likely to be unhappy overall.
- 5. Delivery capacity and timescales decide results.** Councils lacked staff and expertise (Towns Fund). Deadlines of 12–18 months and immature supply chains cut retrofit ambitions (SHDF/WHR). The SIB's three years were too short for the most complex needs. No programme funded running costs after it ended.

The evidence is also weak on value for money almost everywhere. Saturation costs exceeded benefits, Housing First is not cost-saving, and the SHDF(D) cost per home rose.

Stakeholder map

In most of these programmes, residents and tenants were affected but only occasionally consulted. The tool is meant to close that gap.

Policy	Gained	Lost or at risk	Consulted or involved	Resident voice in the evaluation
Estate renewal	Property owners, incoming residents*	Existing renters (rents up, possible displacement)*	Varies by scheme	None: no study tracked existing residents
Neighbourhood saturation	Some groups: concentrated minority communities, less employable residents	The most employable (earnings fell in StepUP)	Residents steered NDC	Limited
London Homelessness SIB	The rough sleeper cohort, providers, investors (repaid with interest)	People with the most complex needs (3 years too short)	GLA, DCLG, boroughs, St Mungo's, Thames Reach, investors, cohort members	Yes: interviews with cohort members
Housing First and similar	Chronically homeless people with high needs	People with lower needs; isolated single tenants	Service users in trials	Wellbeing measures
Towns Fund	Facility users, local businesses (more confidence)	Residents and businesses disrupted by works	Town Deal Boards, councils, businesses, community groups	Yes: surveys in 5 areas (about 310 responses each) and more than 50 interviews
Levelling Up Fund	Owners near new infrastructure*	Renters in the same areas*	Councils (bidders)	Not assessed

Policy	Gained	Lost or at risk	Consulted or involved	Resident voice in the evaluation
SHDF(D) / WHR	Social tenants (warmer homes), the retrofit supply chain	Tenants who faced poor workmanship or broken promises	Councils, housing associations, installers, tenants through resident liaison officers	Yes: survey, interviews, mobile diaries

* Expected from the source's reasoning about price effects, not measured in an evaluation. The map records who gained or lost, not what each group wants.⁹

These are the stakeholder groups the tool should represent: private renters, social tenants, homeowners, homeless and housing-vulnerable people, councils, housing associations, private landlords, delivery partners and investors, and local businesses.

Evidence gaps

The biggest gap is systematic evidence from London residents themselves. That is the gap the tool is built to fill, so it strengthens the pitch.

- **Stakeholder priorities:** none of the sources record what residents, landlords or councils want, only who gained or lost. The tool will need to collect this itself.⁹
- **Resident voice:** the SIB, Towns Fund and SHDF(D) include some residents' views, but none covers London renters in general.
- **London-specific evaluation:** only the SIB is London-only. The EHS figures are England-wide, with London broken out only in some tables and reports.
- **Supply and planning policy:** nothing here evaluates housebuilding targets, affordable housing quotas, rent regulation, Local Housing Allowance or the Renters' Rights reforms.
- **Age:** the estate renewal review is from 2015 and the affordability reports are from 2015-16 and 2018-19. Most evaluations measure economic outcomes, not housing ones.
- **Unfinished evaluations:** the Towns Fund findings are interim, and its final report was due in March 2026.⁷

Open question for the team: which extra sources should come next? Candidates include GLA housing data, London Datastore rents, and statutory homelessness and temporary accommodation statistics.

Data notes

- **Terminology change:** 'Housing Benefit' becomes 'housing support' (Housing Benefit plus the housing element of Universal Credit) from 2021-22 in FA3201 and FA3221. Check comparability before building trends.
- **Label error:** the FA3201 2021-22 sheet is titled '2022-23' inside the file.

- **Stock base:** DA1101 for 2021 covers occupied dwellings only; other years cover all dwellings. Floor area was not collected in 2021-22.
- **Mobility definitions:** FT4101 changed its definition in 1995-96 and the survey changed in 2008-09, so pre-2008 figures are not directly comparable.
- **Income measures:** EHS affordability uses either household reference person plus partner income or all household income. The 2015-16 report shows these give quite different ratios.
- **Suppression:** 'u' in EHS tables means fewer than 5 unweighted cases.

Notes on what couldn't be fixed

These limits can't be resolved from the project files. Each is numbered where it appears in the document.

1. **Tool import:** every card now shares the six core fields, but some carry extra fields (for example Payment by results, Structural point). The tool's schema needs to allow optional fields or drop them.
2. **Inflation:** now adjusted with the ONS Consumer Prices Index (see Rents after inflation). What remains: CPI tracks prices, not incomes, so a flat real rent does not mean rent is no harder to afford. Use the share-of-income figures for that.
3. **Comparison groups:** the London table can't be put on one comparison group from these files. The 2015-16 report compares London with the rest of England; the 2018-19 report compares it with all of England, or with all other regions.
4. **London trend after 2018-19:** the FA rent and housing support tables are England-only. A like-for-like London trend needs EHS regional tables or London Datastore rents, which aren't in the project files.
5. **SIB impact evaluation:** the DCLG impact evaluation isn't in the project files. Its findings are quoted as the qualitative evaluation reports them, and cover only the first two years.
6. **Housing First in London:** the high-certainty evidence rests mostly on one Canadian trial. How well it transfers to London's housing market is untested here.
7. **Towns Fund final report:** it was due in March 2026, but the project files hold only interim reports. Card 5 may be out of date.
8. **Retrofit satisfaction:** an earlier version said 13% of residents were dissatisfied overall. That figure couldn't be traced in either Ipsos report, so it was replaced with the bill figures above. The resident survey is unweighted and not representative.
9. **Stakeholder priorities:** no source records what stakeholders want. The stakeholder map shows only who gained or lost, and some of those cells are inferred.
